DeLaRue Teller Cash Processing System

DeLaRue, the world's largest manufacturer of currency processing equipment and security paper, retained Brooks Stevens Design to assist in the development of a new teller cash processing system to enhance the productivity of front line employees in financial institutions.

Together, DeLaRue and Brooks Stevens Design developed a multi-faceted system that changes the role of bank employees from task-oriented tellers into client-focused revenue generating sellers.

With a host of configurations - including teller or client dispensing, deposit drop boxes, varying levels of security and automation - the new system fits traditional branch lobbies, drive through and in-store branches.

The new system continues a legacy of industry leading banking automation solutions that enhance productivity and customer service while decreasing cost. Sales of the system are exceeding initial expectations.
